

What is Environmental Testing?

Most products whether industrial, automotive, aerospace or military are susceptible to the stress inflicted on them by the environment in which they operate. To avoid recalls, defects and costly warranty issues these products need to be tested in the environment they are going to operate in.

Environmental testing is based on a set of procedures used to determine a products ability to perform during or after exposure to the environment they are to operate in. Length or time of exposure can also be used. These tests allow proof of the products integrity to meet contractual obligations, safe operating conditions and to set realistic warranty terms.

Burnsco Environmental Test Chambers - 110 Decosta St. Arnprior, Ontario, K7S 3G7
